

Hygiene at home – critical aspects and future trends

Caroline Amberg

ASTC Conference, Hefei, 21th November 2019

Introduction of Swissatest Testmaterials ag

Swissatest Testmaterials ag

- **Production and sale of test materials**
 - Washing performance tests (DIN/IEC 60456)
 - Textile testing (ISO 105-F01 etc)
 - Leather testing (ISO/IUF/VESLIC)
- **Development** of tailored, customer-specific test materials
- **Standardisation**

Caroline Amberg / Rita Marques

- Microbiologists
- Swissatest hygiene department: laundry hygiene, microbiological testing, applied R&D, biofilm formation in household devices and water supply systems, Odour formation on textiles

Home hygiene – what is it?

All measures that decrease and prevent infection transmission

Priority

Hand hygiene / Personal hygiene

Food hygiene

Safe water

Safe disposal of faeces

General hygiene (laundry, surfaces, toilets, bath, sink)

Disposal of solid waste

Control of wastewater and rainwater

Situations where there is more risk / Care of infected persons / Care of more vulnerable persons

Future trends affecting hygiene at home

Climate change / pollution / resource scarcity

Demographic / social changes

Health

Home hygiene

The best way to predict the future, is to create it!
- or to shape it!
- or to invent it!

Abraham Lincoln / Willy Brandt and others in different variations....

Megatrends: Growing world population

Our World
in Data

World population growth, 1700-2100

Annual growth rate of the world population

World population

Data sources: Our World in Data based on HYDE, UN, and UN Population Division [2019 Revision]
This is a visualization from [OurWorldinData.org](https://www.OurWorldinData.org), where you find data and research on how the world is changing.

Megatrends: Aging society / Silver society

Percentage of population aged 65 or over, 2020

Percentage of population aged 65 or over, 2050 (medium-variant projection)

Percentage aged 65 or over

- 35 to 40
- 30 to 35
- 25 to 30
- 20 to 25
- 15 to 20
- 10 to 15
- 5 to 10
- 1 to 5
- No data

- Reduced immunity to infection
- Increased risk of death from gastrointestinal disease
- More special care at home

The designations employed and the presentation of material on this map do not imply the expression of any opinion whatsoever of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted line represents approximately the Line of Control which has not yet been agreed upon by the parties. Final boundary between the Republic of Sudan and the Republic of South Sudan is subject to final agreement between the two parties. The United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Megatrends: Climate change and resource scarcity

Aletsch-Glacier: UNESCO World Heritage site

1856

1908

1980

2050?

Social dilemma:
Individual profits and the whole group loses

Human beings as rational decision maker?
- automated, unconscious, 'emotional'
- rational, conscious
→ Policy change is often the fastest route to individual behaviour change!

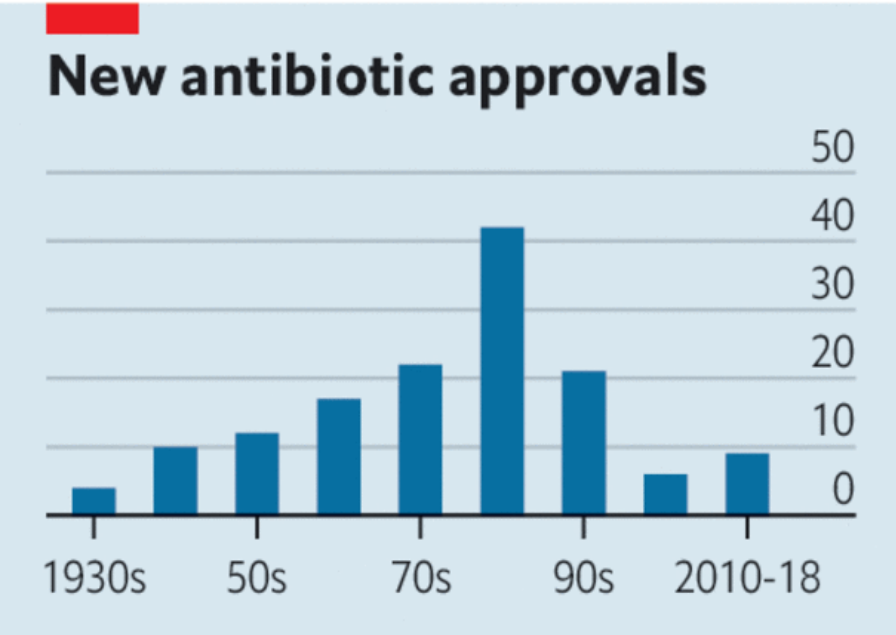

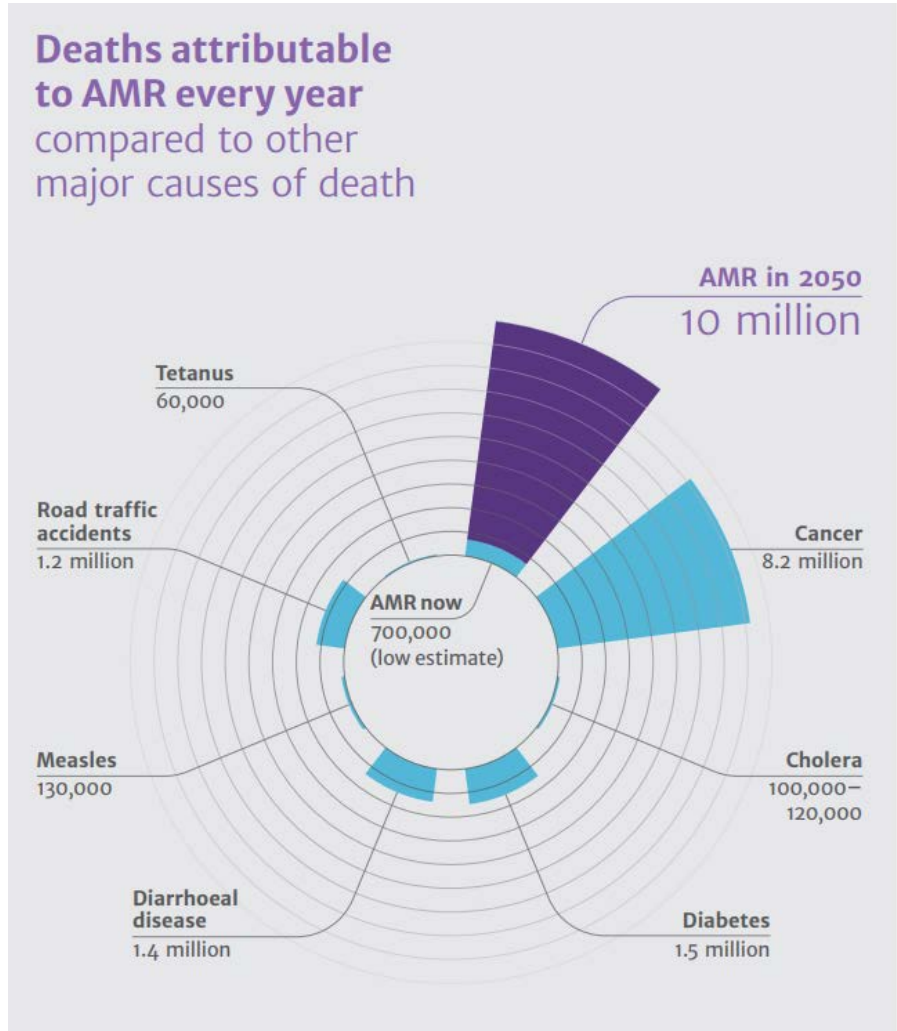

Megatrends: Antibiotic resistances

Health

- Need for more infection prevention
- Prevention of AMR-transmission

The Economist

4th May, 2019, online article

The Review on Antimicrobial Resistance, Chaired by Jim O'Neill (2014)

Megatrends: Allergies / autoimmune diseases

Health

‘Hygiene Hypothesis’ = ‘We have become too clean for our own good’

Scientific consensus today:

- Reduced microbial exposure and diversity due to western lifestyle
- Regulation of immune response in early life
- ‘Old Friends’ and ‘diversity hypothesis’: microbiome

Source: IFH Report (2012). The hygiene hypothesis and its implications for home hygiene, lifestyle and public health.

Megatrends: Microbiome

Microbiome is impacted by

- + Food
- + Mood / stress
- + Antibiotics
- + Use of cosmetics / deodorants / shower gels / shampoos / washing detergent? / softener?

-high diversity = healthy microbiome
-reduced diversity due to western lifestyle and personal hygiene products (preservatives)
-impact of laundry product (fabric softener) unclear

Microbiome impacts:
-our immune system
-weight
-mental health
-etc.

Health

Picture from Dr. Paul Clayton - The microbiome and the brain

Conflicting needs and trends in home hygiene

Climate change / pollution / resource scarcity

Demographic / social changes

Health

Home hygiene

Our home as a hygienically safe place?

The home is an environment where infections are transmitted, a proper home hygiene helps to prevent infection transmission

Dirty public area versus safe and clean homes?

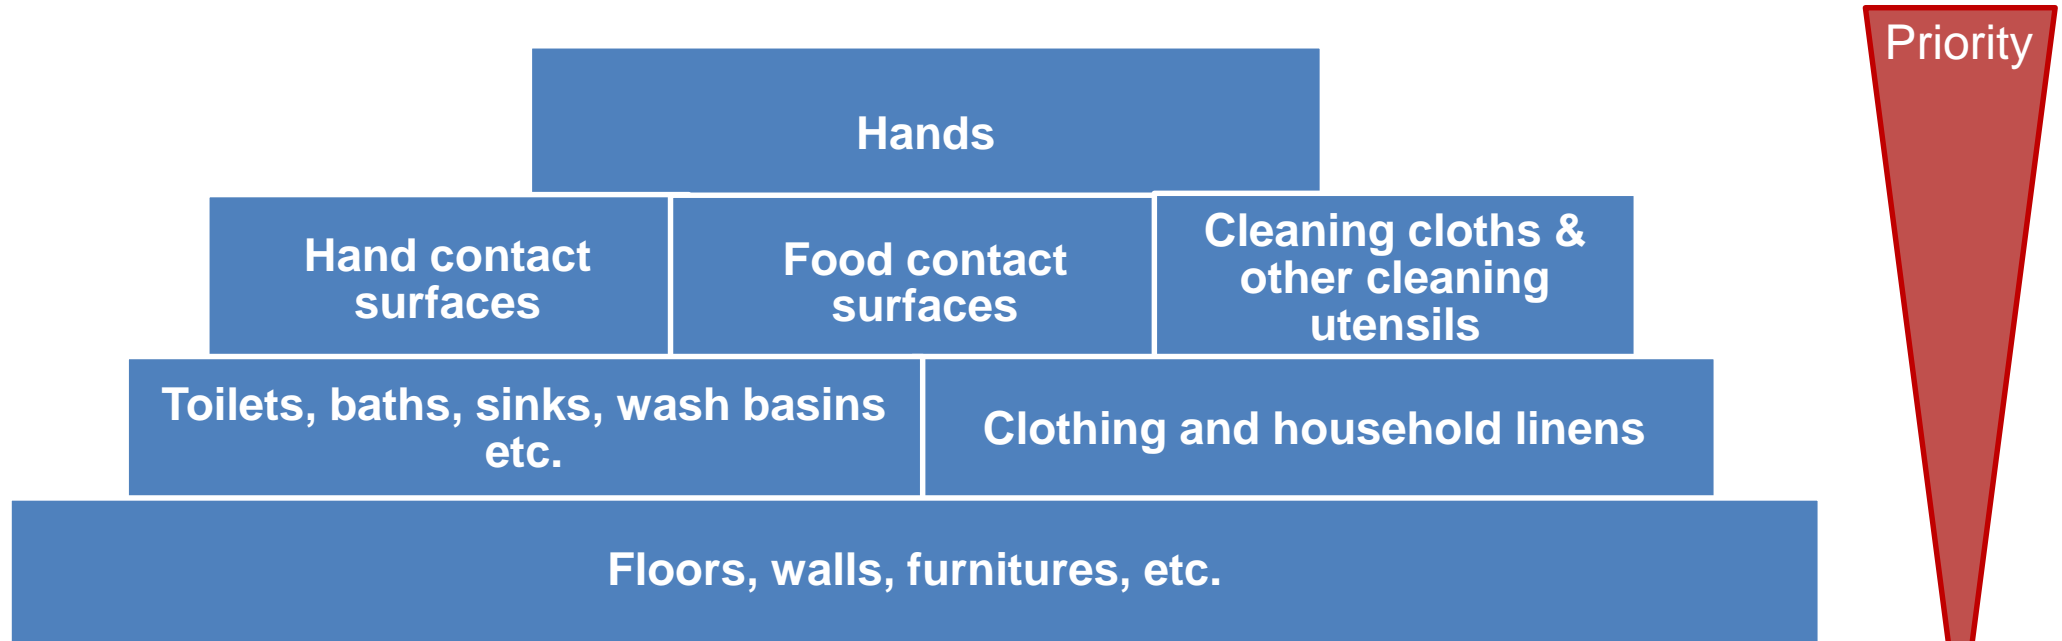

Public restrooms are often more hygienic than the kitchen at home

Critical places at home

- + Kitchen!
- + Surfaces (hand / food contact)
- + Cleaning clothes
- + bathroom

Vectors for infection transmission

- + Respiratory infections (cold, flu): inhalation, hands
- + Diarrhoeal diseases: hands, contaminated food or water
- + Skin and eye infections: hands

Source: IFH report (2011). *The infection risks associated with clothing and household linens in home and everyday life settings, and the role of laundry*

Food-associated infections

- Food-borne infections are highly prevalent

- **Norovirus**
- **Salmonella**
- **Campylobacter**
- **Rotavirus**
- **E. coli**
- **Listeria**

Campylobacter jejuni
(Wikipedia)

Salmonella typhimurium
(Wikipedia)

E. coli
(Wikipedia)

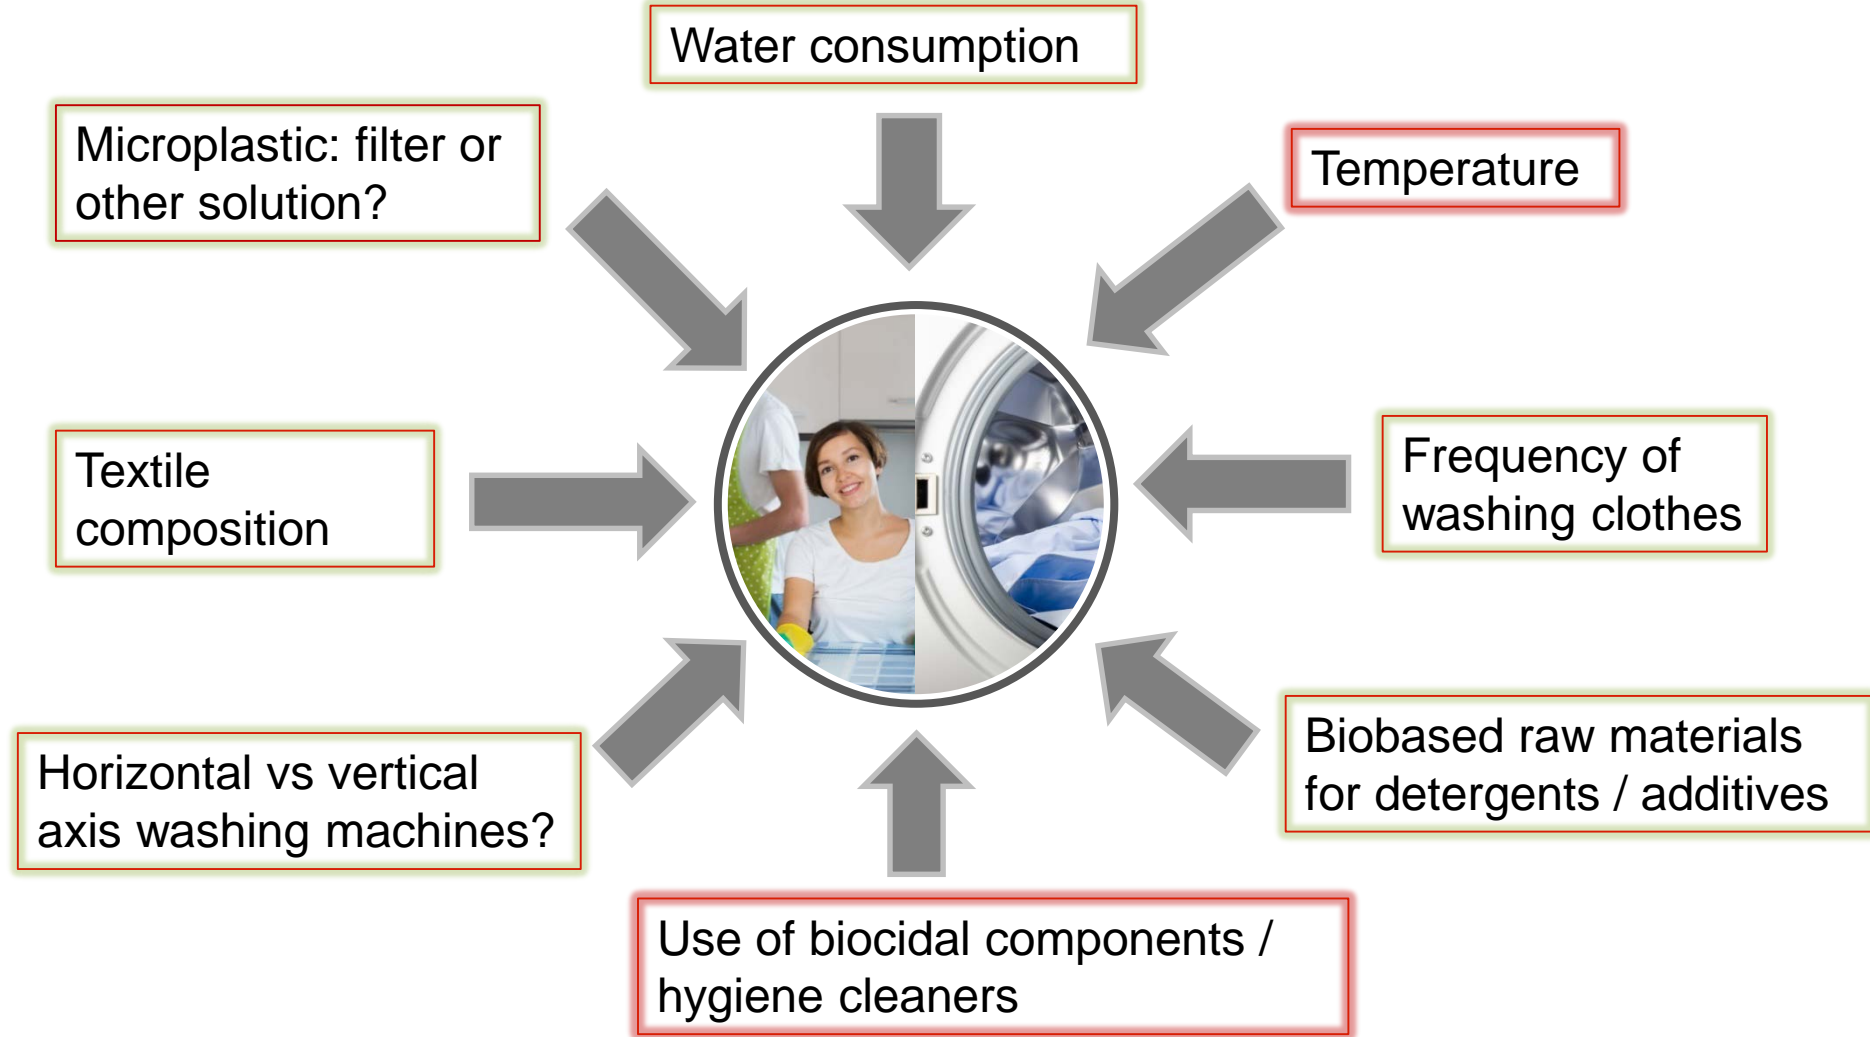

Listeria sp.

- Majority of those infections are acquired at home
- The kitchen as the most critical area in the home

Laundry hygiene – conflicting needs and trends

Washing temperature

Energy saving for 10°C less

	Finland, Sweden, Norway	Spain, Portugal
Average washing temperature	45°C	33-36°C
Energy consumption per cycle [kWh/cycle]	0.7	0.44-0.5

→ 0.2 to 0.25 kWh savings per cycle

Gooijer & Stamminger (2016). Tenside Surf. Det., 53 (5), 402-409

Microbial reduction for 10°C less

15 min main wash cycle, detergent without AOB

→ Significant lower microbial removal

Honisch, Stamminger & Bockmuehl (2014). J. Appl. Microbiol., 177, 1787-1797

Washing temperature

Is washing at 20°C critical?

45 min main wash cycle, detergent without and with AOB

- Answer: It depends!
- Use of detergents with AOB can help to achieve a sufficient microbial reduction even at 20°C
- Not true for fungal strains (Dermatophytes as athlete's foot)

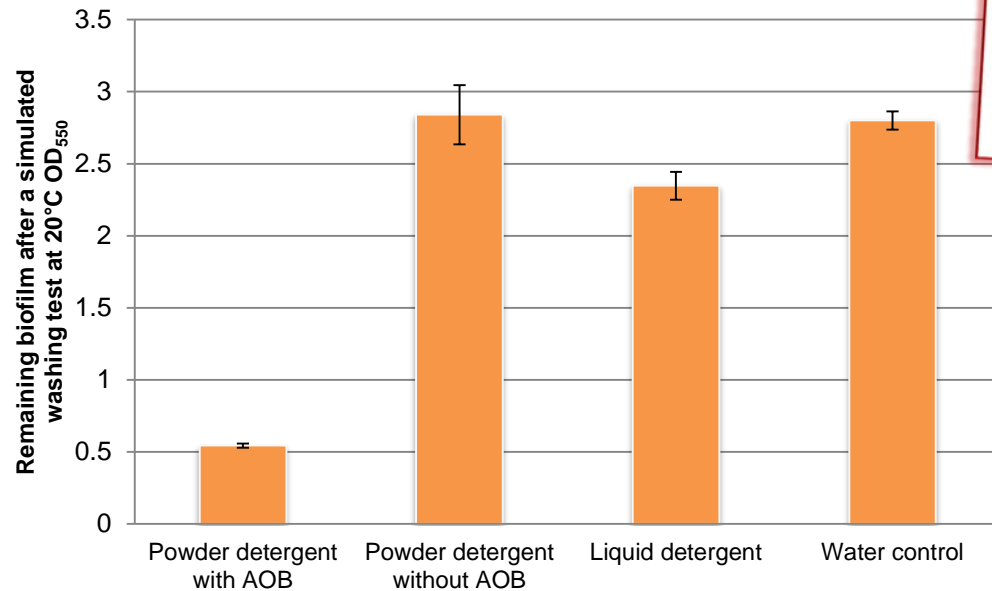

Honisch, Stamminger & Bockmuehl (2014). J. Appl. Microbiol., 177, 1787-1797

Washing temperature

Biofilm and malodor formation?

20°C, simulated washing test, 30 min, main wash, two rinsing cycles

- Use of detergents with AOB can help to delay biofilm and odor formation
- At 20°C total prevention of biofilm and odour formation not possible
- Washing machine cleaning cycles at 60°C with additional biocidal acting products?
- Loss of all saved energy?

Internal investigation Swisstest (2013)

Use of biocidal components / laundry cleanser

Do some active substances induce antimicrobial resistance?

- Chlorhexidin, Triclosan may promote antimicrobial resistance development (Judkina, Marathe, Flach & Larsson, 2018)
- Metastudies: contradictory results of laboratory and in situ studies

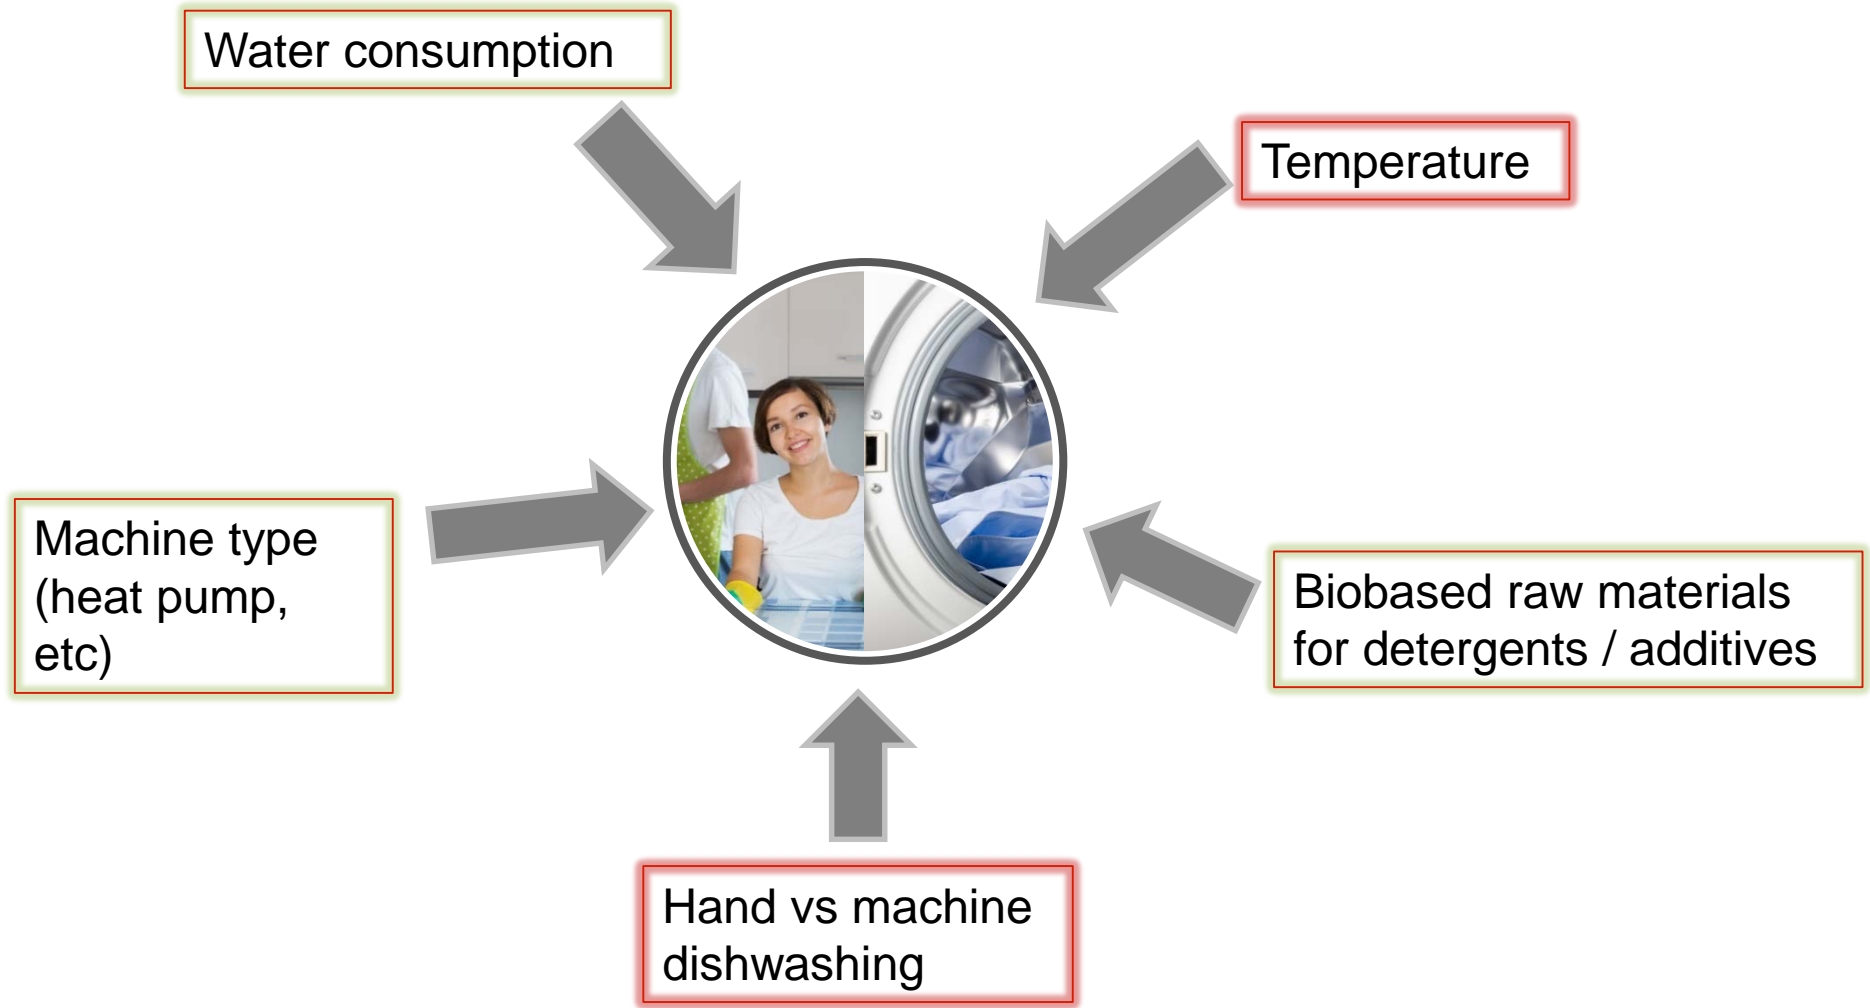

Health care at home: Special disinfecting laundry product may be needed in certain situations

- Are the used disinfectant / biocides safe or do they increase the AMR-problem?
- Impact on microbiome?
- Further research needed!

Judkina, Marathe, Flach & Larsson (2018). Science of Total Environment, 616/617, 172-178.
Donaghy et al. (2019): J Food Protection, 82(5), 889-902.

Dishwashing hygiene – conflicting needs and trends

Dishwasher hygiene – critical aspects

- + Pathogens are present and circulate in kitchen
- + Microbial transfer from dish to food can occur
- + Dishwashing helps to break the chain of infection: *dish / cutlery / cutting boards reduced to acceptable level*
- + Visible cleanliness alone \neq safe surface / dish
- + Pathogenic fungal strains in the dishwasher (Exophiala)?

**Impact of temperature =
major factor
-what about $<50^{\circ}\text{C}$?**

Mattick, K. et al. (2003). Int. J. Food Microbiol., 85, 213-226;
Brands, B., Bockmühl, D. (2015). Tenside Surf. Det. 52, 2, 148-154.;
Stahl-Wernersson, E., Jeppsson, M., Hakanson, H. (2006). Journal of Foodservice, 17, 111-118

Hand vs machine dishwashing

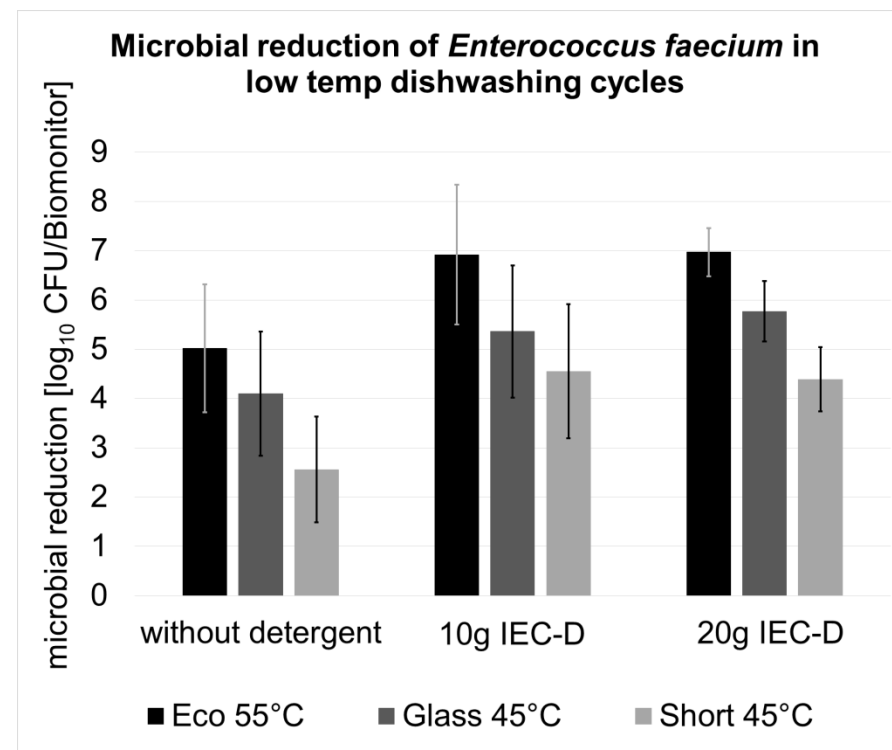

- + In manual dishwashing, no microbial reduction due to temperature or chemistry
- + The highest reduction in automatic dishwashing due to temperature and chemical action

Machine dishwashing is better from a hygienic AND environmental point of view

Ihne, S. (2006). ISBN 978-3-8322-5410-0

Dishwashing temperature

- temperature and AOB-containing detergent = main hygiene contributors
- short cycles are more critical
- a microbial reduction of $> 5 \log_{10}$ steps only achieved in Eco 55°C

Amberg (2018). Microbial reduction in low temperature dishwashing cycles, Tenside Surfactants Detergents 55 (5), 383-390

What can we do to shape the future?

+ Build a scientific data base

- Impact of temperature, detergents, time, water consumption, programs etc. on microbial reduction (washing machines / dishwasher)
- Biocide induced antimicrobial resistances (preservative, softener)
- Impact of laundry / personal care products on microbiome
- How can biofilm and odour formation in washing machines / dishwashers be prevented

+ Find technical solutions

- Microplastic
 - Filter or alternative idea
 - Synthetic textiles will be needed in the future and are also 'sustainable'

A comprehensive view and joint actions are needed!

Distinguish between normal and critical situation

+ Normal situation with healthy family members

- Lowest temperature needed from a hygienic point of view
- powder detergent with bleach for washing / dishwashing
- Only products that are absolutely needed
- Wash less, wear longer / full loads
- Keep your devices in a good state to avoid biofilm and odor formation
- Don't use disinfecting products for surface cleaning / hand dishwashing etc.

**Targeted hygiene measures
= green + clean**

Distinguish between normal and critical situation

**Targeted hygiene measures
= green + clean**

+ **Critical situation**

- Necessary temperature from a hygienic point of view
- AOB-containing detergents
- Hygiene cleanser for washing
 - Health care at home
 - Gastrointestinal disease of family members
 - Immunocompromised family member
- Disinfecting surface and hand cleanser
- Targeted use of hygiene cleanser!

Thank you for your attention!
